

## Cold Aisle Containment System

The Cold Aisle Containment System is a passive cooling solution which can be easily applied to improve the efficiency or expand the capacity of a data center with minimal incremental cost. By containing the cold air supply and isolating it from the rest of the room, cold aisle containment prevents mixing of cold and hot air. The room's perimeter cooling system can now operate more efficiently because it does not have to compensate for the detrimental impact of mixed airflow. This allows the cooling system to operate at higher temperatures while still sufficiently and safely cooling the equipment. Higher temperatures reduce energy costs through lower fan speeds, higher chilled water temperatures, and more frequent use of free cooling. This efficiency also provides additional capacity to cool greater heat densities with the existing cooling system without investing in more costly active supplemental cooling products.

**Easy to Install** – Quickly and easily attaches to VersaPOD, V600 and V800 cabinets

**Retrofittable** – Leverages existing perimeter cooling system and hot aisle / cold aisle arrangement

**Thermal Isolation** — Robust seals and self-closing doors ensure optimal isolation between hot and cold air
